THREE THINGS TO DO

Payhip & Email Sign-In Setup

The Virtue Library now asks for an email address and sends a six-digit code. The code side is built, tested and live. Three things still need your hands, because they live inside accounts only you can sign in to. About 25 minutes in total.

Do step 1 first — today

Your website now says **$12/month** for The Lantern, but Payhip is still charging **$9**. Until you change it in Payhip, anyone who subscribes pays $9 while the page promises $12.

That gap is the only thing on this list that costs you money every day it waits.

1 Change the Lantern price to $12 in Payhip

5 MINUTES

Sign in at **payhip.com** and open **Products** in the left sidebar.

- Click **The Lantern** — it is the product at `payhip.com/b/shRga`.
- Open the **Pricing** tab.
- Change the monthly amount from **9.00** to **12.00** and save.

The question Payhip will ask you: it will offer to apply the new price to people who already subscribe, or to leave them alone.

Leave your existing subscribers on $9. Grandfathering the early ones costs you very little right now and it buys real goodwill — they signed up when the library had 91 stories, and telling them their price never changes is a kindness they will remember. New subscribers pay $12.

Your 7-day trial coupon (`ASJGY784WN`) keeps working and does not need to be touched.

2 Switch on the Payhip webhook events

5 MINUTES

This is the one that was quietly broken. Your site checks with Payhip to see whether an email belongs to a paying subscriber. Payhip was sending the notice, but it labels the email address differently depending on the event — **buyer_email** on a one-off purchase, but **customer_email** on a subscription. Your dashboard was only reading the first one.

The result: every subscription notice arrived with a blank address. Real subscribers were turned away, and cancellations were never noticed, so a cancelled account would have kept working forever.

The code side is already fixed and pushed. Your `lst-dashboard` repository now reads every field name Payhip uses, and builds the subscriber's name from `customer_first_name` and `customer_last_name`. It is tested against all nine payload shapes Payhip sends.

1. Payhip webhooks: events, payloads and setup — help.payhip.com/article/115-webhooks
2. Payhip pricing and plan editing — help.payhip.com/article/68-how-to-sell-memberships-subscriptions
3. Resend domain verification and DNS records — resend.com/docs/dashboard/domains/introduction
4. Vercel environment variables — vercel.com/docs/environment-variables

What you need to do: redeploy the dashboard so the fix goes live, then confirm Payhip is actually sending the events.

In Payhip, click **Account** at the top right, then **Settings**, then the **Developer** tab. There is no Integrations menu — this is the only place webhooks live. The direct link is payhip.com/settings/developer.

Your webhook is already connected and sending. I checked your database: seven events arrived between 24 and 30 July, covering purchases, a new subscription and four cancellations. So this step is a confirmation, not a setup job. Make sure all four boxes are ticked and the endpoint is filled in:

Event	Why you need it
`paid`	Someone buys a one-off product
`subscription.created`	A new Lantern subscriber — this is what opens the library
`subscription.deleted`	A cancellation — without it, access never ends
`refunded`	You refund someone, so access should close

The webhook address to paste, if the field is empty:

```
https://<your-dashboard-domain>/api/webhooks/payhip
```

Payhip has a **Send test** button next to the webhook. Press it, then open your dashboard's events page. A row should appear **with an email address in it** — that blank column was the bug.

3 Turn on the sign-in emails

15 MINUTES

Right now, if a parent enters their email on the library page, the site answers politely: “Email sign-in isn’t switched on yet.” Everything behind it works — it just has no post office yet. Mailchimp cannot do this job; it sends campaigns to lists, not instant one-off codes to a single person.

Resend is the right tool: free for 3,000 emails a month, which is far more than you will need, and it sends from your own domain so the code arrives from `stories@littlescripturetravelers.com` rather than a stranger.

Sign up and verify your domain

- Go to **resend.com** and create a free account.
- Open **Domains** and add `littlescripturetravelers.com`.
- Resend shows you three DNS records — one **MX** and two **TXT** (these are SPF and DKIM; they are what stops your code emails landing in junk).
- Add those records wherever your domain is managed. If the domain sits with Vercel, that is Vercel > Domains > littlescripturetravelers.com > DNS Records. Copy each value exactly.
- Wait for Resend to show **Verified**. Usually a few minutes, occasionally a few hours.

1. Payhip webhooks: events, payloads and setup — help.payhip.com/article/115-webhooks
2. Payhip pricing and plan editing — help.payhip.com/article/68-how-to-sell-memberships-subscriptions
3. Resend domain verification and DNS records — resend.com/docs/dashboard/domains/introduction
4. Vercel environment variables — vercel.com/docs/environment-variables

- Then open **API Keys**, create one with **Sending access**, and copy it. It begins with `re_` and it is only shown once.

Then send me that key and I will finish it

Paste the `re_...` key into our chat and I will add it to the site and redeploy. That is the last piece — codes start arriving the moment it is in.

If you would rather do it yourself: in Vercel open the **little-scripture-travelers** project, then **Settings > Environment Variables**, add `RESEND_API_KEY` for **Production**, and redeploy.

I have already set the other two settings this needs — the signing key that keeps sign-ins tamper-proof, and the from-address.

WHILE YOU WERE AWAY

What changed on the library

The old gate looked like a lock but was not one. Every one of your 91 stories — the full text, the Remember This lines, the bedtime prompts — sat in a single file anyone could download without signing in at all. That file has been split in two: the browsable details stay public, and the words of the stories now live on the server where only a signed-in reader can reach them.

- **Browsing stays wide open.** Anyone can search all 91 stories by virtue, feeling, situation or traveler. Nothing is hidden from search engines, so your library still works as the front door to the brand.
- **Three complete stories are free** once a parent enters their email — David and Goliath, Micaiah Tells the Truth, and David Forgives Saul in the Cave. Enough to read a real bedtime story tonight and feel what the subscription is.
- **Every other story shows a 40-word taste** that stops mid-scene. Your stories run about 110 words, so showing a whole paragraph was giving away half.
- **The other 88 need an active Lantern subscription.** The check runs against Payhip live, so a cancellation closes the door the same day — and step 2 above is what makes that check honest.

> **The quiet win:** every email typed into that box is a parent who wanted your stories enough to ask. They are saved and waiting for you — that is a warm list you did not have last week, and it is worth more than the three stories it costs.
